## **DETAILED ACTION**

### ***Continued Examination Under 37 CFR 1.114***

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 07/23/08 has been entered.

### ***Reasons for Allowance***

2. The following is an examiner's statement of reasons for allowance: In response to the office action, dated 08/08, 2008, further in view of applicant's amendments filed on 07/23/08, the application has been carefully reviewed and respectfully considered.

According to applicant's remarks based on currently amended subject matter, as discussed in page 1 through 3, the remarks has been found persuasive and the rejection has been withdrawn. Therefore, independent claims 1 and 8 has been allowed, for the reasons given below:

With respect to claims 1-7, the prior art searched and of record neither anticipates nor suggests an image processing apparatus for applying desired effects to

a stored image, the apparatus comprising an optical reader; a feed mechanism for feeding a card having an array of dots past the optical reader; an optical reader interface that is connected to the optical reader, the optical reader interface able to control the optical reader to detect a data area on the card, to detect a bit pattern corresponding to the array of dots in the data area, and to produce raw data from the bit pattern while the card is being fed past the optical reader, the raw data used to produce an image processing script; and a processor that is connected to the optical reader interface to receive and apply the image processing program to the stored image to generate an output image with the desired effects whereby, the array of dots defines a first resolution and the optical reader has a sensor with a second resolution at least twice the first resolution.

Further, regarding to claim 8, the prior art searched and of record neither anticipates nor suggests a camera which comprises: a housing; an image sensor positioned on the housing for sensing a viewed image and generating pixel data representing the image; an optical reader; a feed mechanism for feeding a card having an array of dots past the optical reader; an optical reader interface that is connected to the optical reader, the optical reader interface able to control the optical reader to detect a data area on the card, to detect a bit pattern corresponding to the array of dots in the data area, and to produce raw data from the bit pattern while the card is being fed past the optical reader, the raw data used to produce an image processing script; and, a central processor which comprises an image sensor interface that is connected to the image sensor to receive the pixel data from the image sensor, and that is connected

to the optical reader interface to receive and apply the image processing script to the pixel data so that the pixel data can be transformed and written to a data storage device where by, the array of dots defines a first resolution and the optical reader has a sensor with a second resolution at least twice the first resolution.

Therefore, claims 1-8, are Allowed for the reasons the claimed invention are distinct from the prior art searched and of record neither anticipates nor suggests the claimed invention as amended.
